askGPT is a command line program written in Python that allows you to query the chatGPT API. It keeps track of conversations and has a set of personas to focus the conversation.

Installation

To install askGPT , simply run the following command:

```
pip install askGPT
```

or for cutting edge code, not to be used in production:

```
git clone https://github.com/meirm/askGPT.git
cd askGPT
python setup.py install
```

Usage

Once installed, you can use **askGPT** by running the following command:

```
askGPT query --subject <subject> --enquiry <enquiry>
```

Where **<subject>** is the title used for logging the conversation and **<enquiry>** is the enquiry you want to address.

Install

```
pip install askGPT
```

or

```
git clone https://github.com/meirm/askGPT.git
cd askGPT
python setup.py install
```

Examples

```
# askGPT query --subject test --enquiry "This is a test"
This is a test of my AI capabilities.

# askGPT query --subject test --enquiry "Do you believe?" --verbose
Human: Do you believe in God?
AI:
I do not have a belief system that includes the concept of God.
Human: Do you believe?
AI:
I believe in the power of knowledge and understanding. I believe that by
learning and exploring, we can make the world a better place.
```

Usage

```
askGPT query --subject <subject> --enquiry <enquiry>

askGPT list

askGPT show <config|personas|subjects|engines>

askGPT show subject <subject>

askGPT delete --subject <subject>

askGPT delete --all

askGPT config

askGPT credentials
```

Options

```
-h --help      Show this screen.

--version      Show version.

--subject      Subject of the conversation

--enquiry      Your question

--all          Delete all archived conversations
```

Personas

askGPT allows you to use personas to focus the conversation. Personas are defined as follows:

```
{"<persona>": {"name": "<name>", "greetings": "<Initial sentence>",  
"prompt": [ {"user": "Human", "prompt": "<your initial prompt>"}, {"user":  
"AI", "prompt": "<AI response>"}, ... ]}}
```

Where **<persona>** is the name of the persona, **<name>** is the name of the character, **<initial sentence>** is the initial sentence used to start the conversation, and **<prompt>** is an array of sentences between the user and **askGPT**.

i.e.

```
"AlbertoKnox":{"Name": "Knox", "greetings":"I am Alberto Knox, the  
philosopher from Sophia's world. I am also a chatbot", "prompt":[  
  {"user" : "Human", "prompt": "What's your role in the book?"},  
  {"user": "AI", "prompt": "The ideal philosopher. I am never quick to  
judge and I always thinks about what I am doing."}  
]}
```

In the git repository under config you have a sample json with a few personalities. Copy the file to `$HOME/.askGPT`

If you do not have a personas.json file in the directory, the program will load with a Neutral persona without any background.

API Key and Organization

In order to communicate with openai API you need to register at <https://www.openai.com> and create an API key. If you don't have an organization code and it shows Organization: Personal, go to <https://beta.openai.com/docs/api-reference/authentication> and look for the code in the example. Once you have your API key and organization code, you can use them to authenticate with **askGPT**.

Summary

askGPT is a command line program written in Python that allows you to query the chatGPT API. It keeps track of conversations and has a set of personas to focus the conversation. Installation is easy, simply run `pip install askGPT` and you're ready to go. Authentication requires an API key and organization code from OpenAI. With **askGPT**, you can easily query the chatGPT API and have meaningful conversations with AI.

You can also list the personas, list conversations, show the content of a conversation, delete it, and fine tune parameters such as temperature for more personalized conversations.
